Where does weight-space programming fix failures?

NVIDIA Cosmos3 Edge Policy (world-action model) and NVIDIA GR00T N1.7 DROID (VLA on a Cosmos-Reason2-2B backbone), with OpenPI π0.5 as the control, on the same RoboLab DROID tasks T1–T8 and a retention task R1.

Method. When a clearer wording of the same goal makes a robot model succeed, copy that wording's internal effect into the weights in closed form, one least-squares solve per layer: no training, and the instruction stays the same.

π0.5, the control (earlier records). Distillation fixed its two language failures: T1 27 → 106 of 128 unseen starts (81 fixed, 2 broke, $p = 7.2 \times 10^{-22}$) and T8 0 → 27 of 64; a random edit of the same size did nothing (9 vs 13 of 64); the T1 edit also lifted T2 and T3; no edit helped T4–T7.

NVIDIA models. Cosmos3 Edge Policy: running; GR00T N1.7: running. Same tasks, slots, metrics and statistics; this brief refreshes as runs finish.

What weight-space programming did on each task, on unseen starts

	Cosmos3 Edge Policy world-action model	GR00T N1.7 reasoning-backbone VLA	π0.5 OpenPI VLA, control
T1 Cube then banana	*running*	*running*	fixed: 27 → 106 of 128 distilled edit; 81 / 2, $p = 7.2 \times 10^{-22}$
T2 Pick up the eyeglasses	*running*	*running*	lifted by the T1 edit: 22 → 44 of 64 its own edit: 18 → 27 of 64, not significant
T3 Cube left of the bowl	*running*	*running*	lifted by the T1 edit: 8 → 36 of 64 no own edit submitted
T4 Stack yellow on red	*running*	*running*	no gain lookalike perception; no clear wording to distil
T5 Mustard into the left bin	*running*	*running*	no gain its own edit: 8 → 11 of 64; the grasp slips
T6 Stack three cubes	*running*	*running*	no gain its own edit: 35 → 39 of 64
T7 Pick up the flat box	*running*	*running*	no gain a skill the policy lacks; 0 of 64 unedited
T8 Mustard right of the raisin box, reference-first	*running*	*running*	fixed: 0 → 27 of 64 distilled edit; 27 / 0, $p = 1.5 \times 10^{-8}$
R1 Retention task	*running*	*running*	kept: 32 → 32 of 32 cube into the bowl, T1 edit
Random control, same size	*running*	*running*	9 of 64 T1; unedited 13, edit 50
Where to edit	*running*	*running*	VLM 55, action expert 20, head 0 of 64 T1; unedited 5; only the VLM edit transfers

	Cosmos3 Edge	GR00T N1.7	π0.5
T1 Cube then banana	*running*	*running*	4/32 · 13%
T2 Eyeglasses	*running*	*running*	12/32 · 38%
T3 Cube left of bowl	*running*	*running*	5/32 · 16%
T4 Stack yellow on red	*running*	*running*	13/32 · 41%
T5 Mustard into left bin	*running*	*running*	6/32 · 19%
T6 Stack three cubes	*running*	*running*	16/32 · 50%
T7 Flat box	*running*	*running*	0/32 · 0%
T8 Mustard, reference-first	*running*	*running*	0/32 · 0%
R1 Retention task	*running*	*running*	32/32 · 100%

Unedited success on each shared task; darker is higher. Each cell gives successes of starts.

	Cosmos3 Edge	GR00T N1.7	π0.5
T1 Cube then banana	*running*	*running*	+79 / 128*
T2 Eyeglasses	*running*	*running*	+22 / 64*
T3 Cube left of bowl	*running*	*running*	+28 / 64*
T4 Stack yellow on red	*running*	*running*	+3 / 32
T5 Mustard into left bin	*running*	*running*	+5 / 32
T6 Stack three cubes	*running*	*running*	+5 / 32
T7 Flat box	*running*	*running*	±0 / 32
T8 Mustard, reference-first	*running*	*running*	not run
R1 Retention task	*running*	*running*	±0 / 32

gain, $p < 0.05$ loss, $p < 0.05$ no detectable change

* $p < 0.05$; outlined: the edit's own task

Each model's main edit, unchanged, on every suite task: edited minus unedited successes on the same starts. Teal: a gain, dark: a loss (exact McNemar $p < 0.05$); grey: no detectable change; the outlined cell is the task the edit was built for.

Draft for discussion. Simulation only (RoboLab, Isaac Sim), one released checkpoint per model, shared slots 30000–30031 and 96000–96063 with identical initial scenes; π0.5 cells are earlier records on their own slots until its shared-slot runs land. Exact McNemar tests on paired starts.
